Agree the scope, then freeze it

Production: BOSGAME | Future v2 lab: HP | Baseline: Aster v1.0.5

Decision now: align the HP with v1.0.5, then hold feature development. Use both boxes on the beta baseline until this list has been reviewed. No v2 implementation is authorized by this document.

How to mark this copy: tick items to include; cross out or write DEFER beside others. Add ideas in the notes. P1/P2 labels in the research were recommendations, not commitments. This review deliberately separates delivered work from future proposals.

Scope agreement

After your review, create a bounded v2 project with selected item IDs, priorities, acceptance tests, dependencies, recovery steps and milestones. HP is the development target; BOSGAME remains the family beta/production baseline. Promote only a separately accepted candidate.

After the scope is set: the only automatic additions are obvious corrective fixes arising from v1.0.5 beta testing. Record those as defects with reproduction and regression tests. New features go into a future-ideas list unless you explicitly approve a scope change. No open-ended "while we are here" work.

Media pages and navigation

- ☐ **01 Purpose-built series / season / episode page**
  Series hero and unwatched count; Resume next as primary action; compact season chooser (hide for one season, keep Specials); vertical episode rows with still, S/E, synopsis, duration, date and fixed progress/watch state. Preserve focus on return; use real metadata ordering.
- ☐ **02 A consistent shell and global search**
  Stable rail/destination focus, predictable Back, grouped search across film, TV, episodes, music, books and podcasts. Keep YouTube search separate. Calm and truthful empty/loading/stale/offline/denied states.
- ☐ **03 One Continue destination**
  Bring resumable video, audiobook, podcast and eventually reading items together, clearly labelled by source. Depends on real progress authorities; do not invent resume positions.

My notes / changes:

Players and music

Refine the accepted compact player language - do not rebuild delivered v1 work

Shared player refinements

- [ ] **04 Finish the clean modern OSD contract**
  Preserve all ten video actions: Previous, -10s, Play/Pause, +30s, Next, Stop, Info, Audio, Subtitles, Quality. Compact unboxed controls, quiet secondary actions, readable timeline and title; factual active resolution/HDR, not filename claims.

- [ ] **05 Remote behavior and overlay polish**
  Centre for play/pause, bounded seeking, predictable initial focus and auto-hide. Temporary menus can close without stopping; leaving the full player stops media. Verify selectors, reduced motion and focus restoration across every player. Stop-on-exit is already in v1.0.5; this is regression protection.

Music

- [ ] **06 Shuffle**
  A visible, stateful Shuffle action on albums, playlists and the active queue using Kodi's real playlist. Preserve the current track when enabled; keep Repeat distinct.

- [ ] **07 Up Next and queue editing**
  Right-side queue with Play Next / Play Later, remove, save as playlist and confirmed clear. Maintain a simple remote-first player, with album/track context.

- [ ] **08 Listening detail and art-derived atmosphere**
  Quiet codec, bit depth/sample rate and output-path details. Subtle art-derived colour/blur within Aster contrast rules. Album/artist radio only if a genuine service-backed recommendation source exists.

Design acceptance

Use the approved Aster logos and icons, not recreated artwork. The existing recommendations contain a compact OSD visual mockup; it is a spacing/hierarchy reference, not new production art. Keep controls readable from the sofa and avoid heavy permanent panels.

My notes / changes:

Books, listening and Aster Reader

Resume is new v2 work; current v1 audio playback does not synchronize listening progress

Audiobooks and podcasts

- [ ] **09 Audiobook resume across sessions and clients**
  Audiobookshelf is the authority. Save during playback and on pause/Stop/Back; reopen at the saved whole-book position across chapters and multi-file books. Explicit chapter selection starts that chapter. Test restart, outage/retry and update conflicts; never overwrite newer progress with zero.

- [ ] **10 Podcast resume and completion**
  Persist and restore each episode independently through Audiobookshelf, including completion state across clients. Test separately from audiobooks.

- [ ] **11 Audiobook listening tools**
  Keep player/cover left and unboxed chapters right. Add current chapter and whole-book progress, skip controls, speed and sleep presets including end of chapter. Bookmarks only after server authority and multi-client conflict behavior pass.

- [ ] **12 Podcast show pages and episode queue**
  Square show art and synopsis; newest/oldest order; vertical episodes with date, duration, summary, availability and played/progress state. Persistent queue and Play Next/Later. No automatic subscription or download without explicit action.

Reader + synchronized Aster narration: gated proof first

- [ ] **13 A real TV reading page**
  Start with one DRM-free, reflowable EPUB chapter. Retain Calibre as source; sanitize/paginate through a bounded reader service with stable text locations. Adjustable typography, margins/spacing and contrast. Keep the external reader fallback; no source modification or DRM removal.

- [ ] **14 Canonical Aster voice with accurate highlighting**
  Use the existing local Aster voice service (Kokoro bm_daniel), not a second voice stack. Buffer opening sentences; queue/cache private chapter audio and validated word timing or alignment. Highlight spoken words/phrases, follow page turns and support pause, seek, chapters, speed and sleep. Never fake timings from text length.

- [ ] **15 Reader position, privacy and expansion gate**
  Resume at stable EPUB location/text offset; measure drift, latency, pronunciation and remote usability. Cross-device reading authority needs a decision. No cloud book text/narration export. PDF/OCR, fixed-layout and interactive books stay later work.

My notes / changes:

Digest and the Home dashboard

Keep information current, private and easy to control from the remote

Daily Digest and Breaking News

- [ ] **16 Story-aware playback refinements**
  Keep the active image, summary and selected story tied to the audio. Add a compact story-boundary timeline and Next/Previous story controls. Existing story synchronization remains a regression test, not a new feature.
- [ ] **17 Read story, sources and optional briefing queue**
  Expose safe source links and distinguish generated summaries from reporting. Queue morning/evening/saved stories only after stable feed identities and durations exist. Keep Breaking News a separate, glanceable destination.

Home Assistant-style Home page

- [ ] **18 A calm sectioned dashboard**
  Four-column TV grid with sensible spans; group Now, Rooms, Security, Climate and Routines. Small exception-first badges for comfort, air, security, connectivity and timers; distinguish controls from read-only state.
- [ ] **19 Production camera delivery**
  Replace the disposable Mac tunnel with a reviewed, read-only, least-privilege production path. Show freshness, privacy and a real failure reason; never present a stale still as live. No broad camera-network access.
- [ ] **20 Named Home Assistant timers**
  Integrate server-backed named timers if authorized, retaining the accepted local ring timer as an explicit fallback. Keep timer identity and authority clear; preserve alarms and remote accessibility.
- [ ] **21 Household freshness and safe actions**
  Bounded feed publication with last-success/stale state. Confirmation for security-sensitive actions; unavailable controls must not look actionable. Never leak private household data to an idle screen.

Open infrastructure decisions

Camera delivery, Home Assistant permissions, reader service placement and any new feed access require their own bounded design/authorization. Their inclusion on this review sheet does not grant network changes or service deployment.

My notes / changes:

Appliance features and optional trials

Hardware-specific changes must remain reversible and must not block the core release

- [ ] **22 Network status in Aster Settings**
  Remote-friendly link/interface, IP, hostname, link speed or Wi-Fi signal, gateway and DNS. Distinguish cable/DHCP/DNS/service failures. Show last Jellyfin/Audiobookshelf success; safe refresh/reconnect/diagnostics, no secrets. Works even offline.
- [ ] **23 G20 power button: sleep and wake**
  Capture the actual event per box. Persist playback position before supported suspend; keep shutdown/reboot explicit. Prove targeted USB wake, HDMI/HDR/audio/network recovery: ten idle cycles, ten paused-media cycles and overnight. Honest Display off fallback if suspend fails.
- [ ] **24 Aster screensaver and idle presentation**
  Configurable Aster / Dim / Black / Disabled; approved artwork, restrained moving composition and OLED-safe behavior. Optional minimal clock/now-playing. Respect media and timer alarms. First input wakes only; preserve focus and display mode. No private camera/book/household content by default.
- [ ] **25 YouTube: improve the destination and finish setup later**
  Keep this on the review list, but setup/testing is paused until you have time for the official add-on's API credentials. Normal sign-in alone did not complete setup. Decide on a TV-friendly destination before implementation; any desktop-app alternative needs a separate LibreELEC feasibility proof.
- [ ] **26 HP firmware splash: optional guarded trial**
  Investigate approved logo or black POST image using the official model-supported utility only, with recovery media and install/removal evidence. No unsigned editing or security bypass. Firmware updating is separate maintenance, not a prerequisite. Keep working Kodi/LibreELEC Aster splashes independent.
- [ ] **27 Optional external CEC adapter trial**
  Only if coordinated TV/receiver power or input is wanted. Keep the proven USB remote. Validate a separate CEC control path without degrading the accepted 4K/HDR/audio path; test loops, source/sink changes, wake and repeated cycles. Hardware/topology must be rechecked per box.

Earlier ideas needing an explicit include/defer decision

28 - Light Jellyfin mobile branding (not a Kodi skin port). **29 - Older Lenovo / lower-spec bedroom deployment proof** and comparison benchmarks. **30 - Blu-ray fit assessment**, not an assumed integration. These were discussed but are not a committed core-v2 delivery list.

My notes / changes:

Release gates, exclusions and sign-off

Turn selected items into milestones only after your review

- ☐ **31 Focus, accessibility and performance**
  One focus contract across tiles/rows/pills/fields; no clipping, exposed square corners or jumping titles. Reduced motion/high contrast, long-text tests and sofa readability at 1080p/scaled 4K. Bounded/lazy artwork and polling; no permanent worker merely for animation.
- ☐ **32 Repeatable release and recovery evidence**
  Automated focus-graph tests plus live media smoke tests; output/HDR/AVR, temperatures/memory and long-run soak against v1. Preserve immutable packages and independent profile rollback. Promote HP candidates to BOSGAME only after acceptance.

Already delivered / retain as beta regression checks

Compact shared player styling; visible stream/info controls; English language/subtitle preferences; watched/unwatched badges; remote navigation/selection fixes; video/music/news/Books playback corrections; stop-on-exit and video Continue Watching behavior; Kodi/LibreELEC Aster startup branding; bounded six-hour audio catalogue/cover refresh; private recovery backups. Hardware-specific capability still needs evidence, not a universal guarantee.

Explicitly not part of this automatic work queue

No YouTube subscription downloader/archive (not scheduled for v2 or v3). No API setup now. No continued Apple Screen Sharing/VNC experiment: blank-screen trial was abandoned. No eBook handoff expansion just to fill v1; useful on-TV reading is the gated v2 Reader proposal. No BIOS upgrade, broad firewall access, new subscriptions/downloads or automatic BOSGAME feature rollout.

Audiobook/podcast progress synchronization remains unimplemented in v1.0.5. The eBook catalogue is an accepted frozen snapshot; the new audio refresh is not a Calibre refresh. Receiver-volume jumps are a deferred beta issue if reproduced, not a new feature.

My additions / decisions before scope freeze

Approved item IDs: _____

Deferred item IDs: _____

Scope approved by: _____ Date: _____

Basis: existing Aster 2.0 recommendations and conversation decisions through 23 October 2026. This is a review inventory, not a costed plan or a firmware/network authorization. Selected items will become the separately approved version 2 project.
